1 File Manager - Directories

One of the most important aspects of using a file manager is understanding how to navigate and manage directories effectively. This includes creating, renaming, moving, and deleting directories, as well as understanding the hierarchical structure of the file system.

A directory is a container used to organize files on a computer. It can contain files as well as other directories, which are often referred to as subdirectories.

2 Python & pip

2.1 Using pip

2.2 Python Files

3 Venv

3.1 Creating a Virtual Environment

A virtual environment is an isolated Python environment that allows you to manage dependencies for different projects separately. You can create a virtual environment using the following command:

```
python -m venv myenv
```

3.2 Activating a Virtual Environment

To activate the virtual environment, use the following command:

```
source myenv/bin/activate  # On Unix or MacOS
myenv\Scripts\activate     # On Windows
```

4 LaTeX In VScodium

5 BASH

6 GIT

GIT is a version control system that allows you to track changes in your code and collaborate with others. it is usefull for managing code changes and collaborating with others.

6.1 Git Commands

```
echo "# Example_Project" >> README.md
git init
# Initialize a new Git repository

git add README.md
# Stage the README file for commit

git commit -m "first commit"
```

```
# Commit the staged changes with a message

git branch -M main
# Rename the default branch to main

git remote add origin git@github.com:UserName/Example_Project.git
# Add the remote repository

git push -u origin main
# Push the changes to the remote repository

git remote add origin git@github.com:UserName/Example_Project.git
# Add the remote repository

git branch -M main
# Rename the default branch to main
git push -u origin main
# Push the changes to the remote repository
```

In your degree you will use git to manage your code, track changes, and collaborate with your peers on various projects.
